In C, `stdio.h` is a header file that stands for Standard Input and Output. It provides functions and macros for performing input and output operations, such as reading from the keyboard, writing to the screen, and working with files. [v](#)

Here's a breakdown of what `stdio.h` contains:

Functions:

It defines functions like `printf()` for outputting data to the console, `scanf()` for reading input from the user, `fopen()` for opening files, `fclose()` for closing files, `fprintf()` for writing to files, `fscanf()` for reading from files, and many more.

Macros:

It defines macros like `EOF` (End of File), `NULL` (null pointer), and `BUFSIZ` (buffer size).

Variables:

It declares variables like `stdin`, `stdout`, and `stderr`, which represent standard input, standard output, and standard error streams, respectively.

To use `stdio.h` in your C program, you need to include it at the beginning of your code using the `#include` directive:

C

```
#include <stdio.h>
```

Example:

C

```
#include <stdio.h>

int main() {
    printf("Hello, world!\n");
    return 0;
}
```

This program uses the `printf()` function from `stdio.h` to print the message "Hello, world!" to the console.
